

Isotretinoin

Bilateral sacroiliitis: case report

A young female [age *not stated*] developed bilateral sacroiliitis after 4 months of isotretinoin [*dosage, route and indication not stated*]. Isotretinoin was discontinued and her pain gradually resolved after 2 weeks.

Author comment: "*We report a case of a young, female volleyball player. . . suffering from bilateral sacroiliitis induced by systemic isotretinoin treatment for 4 months.*"
