Observation

A 50-year-old man with a history of kidney cancer was referred to our department for evaluation of recurrent left lumbar and hypogastric pain after nephrectomy. On examination, there was no palpable mass. Biological tests were within normal limits. Plain radiograph of the pelvis (Fig. 1) and CT scan (Fig. 2) were performed.

Figure 1. Plain radiograph of the pelvis.

What is your diagnosis?

From the observation, what, from among the following, would your diagnosis be:

- osteochondroma;
- pelvic digit;
- myositis ossificans;

- Fong's disease;
- anterior superior iliac spine avulsion fracture.
